

Data concentrator with interface software

The data concentrator with interface software can be integrated into an existing volume measuring system. The generated dimension and weight information from the measuring process as well as the barcode in the package label are transmitted via the RS 232 and RS 422 interfaces to the concentrator. The concentrator collects, prepares and transmits the data from the measuring to the host system.

For identification, the packages must be provided with a unique barcode. For barcode reading, the system has two alternative sources: an Omni portal laser and a handscanner for the manual scan operation.
